

Simplifying logistics

Modus Consult (Gütersloh, Germany) offers comprehensive solutions for integrating logistics-related information and material flows. The warehouse administration calculator completely manages, controls and monitors the warehouse and picking systems of the "Modus Foodvision" ERP branch software.

This solution is based on Microsoft Dynamics NAV and works with all warehouse management systems, whether chaotic or based on fixed places. Not only does this software visually display all free space within the warehouse system, it automatically makes suggestions regarding deliveries and shipments depending on current disposition data. In addition, it can retrieve information on the inventory levels of individual products at any time. The administration calculator can also automatically rearrange warehouse goods and do MHD verifications. This warehouse administration system is able to help meat-producing companies reduce their storage inventories, thus increasing their liquidity and cash flow. Efficient, optimized utilization and logistics begins at time of purchase, due to the controlled inventory management with Modus Foodvision.

Purchasing, according to Modus Consult, can be done much more precisely and in a timely manner, which leads to increased inventory turnover. Furthermore, the production or warehouse management is automatically informed about idle time and malfunctions. Process planning, management and control are thus organized independently of individual persons, and reliable deliveries are comprehensively guaranteed.
